

GPU Speed Of Light Throughput

All

High-level overview of the throughput for compute and memory resources of the GPU. For each unit, the throughput reports the achieved percentage of utilization with respect to the theoretical maximum. Breakdowns show the throughput for each individual sub-metric of Compute and Memory to clearly identify the highest contributor.

Compute (SM) Throughput [%]	98.71	Duration [ms]	2.95
Memory Throughput [%]	98.71	Elapsed Cycles [cycle]	5,672,769
L1/TEX Cache Throughput [%]	99.00	SM Active Cycles [cycle]	5,657,348.88
L2 Cache Throughput [%]	15.19	SM Frequency [Ghz]	1.92
DRAM Throughput [%]	1.11	DRAM Frequency [Ghz]	7.99

High Throughput

This workload is utilizing greater than 80.0% of the available compute or memory performance of the device. To further improve performance, work will likely need to be shifted from the most utilized to another unit. Start by analyzing workloads in the [Compute Workload Analysis](#) section.

Launch Statistics

Summary of the configuration used to launch the kernel. The launch configuration defines the size of the kernel grid, the division of the grid into blocks, and the GPU resources needed to execute the kernel. Choosing an efficient launch configuration maximizes device utilization.

Grid Size	4,096	Function Cache Configuration	CachePreferNone
Registers Per Thread [register/thread]	40	Static Shared Memory Per Block [byte/block]	0
Block Size	256	Dynamic Shared Memory Per Block [byte/block]	0
Threads [thread]	1,048,576	Driver Shared Memory Per Block [Kbyte/block]	1.02
Waves Per SM	28.44	Shared Memory Configuration Size [Kbyte]	16.38
Uses Green Context	0	Stack Size	1,024
# SMs [SM]	24	# TPCs	12
Enabled TPC IDs	all	-	-

Occupancy

% Occupancy Graphs

Occupancy is the ratio of the number of active warps per multiprocessor to the maximum number of possible active warps. Another way to view occupancy is the percentage of the hardware's ability to process warps that is actively in use. Higher occupancy does not always result in higher performance, however, low occupancy always reduces the ability to hide latencies, resulting in overall performance degradation. Large discrepancies between the theoretical and the achieved occupancy during execution typically indicates highly imbalanced workloads.

Theoretical Occupancy [%]	100	Block Limit Registers [block]	6
Theoretical Active Warps per SM [warp]	48	Block Limit Shared Mem [block]	16
Achieved Occupancy [%]	98.48	Block Limit Warps [block]	6
Achieved Active Warps Per SM [warp]	47.27	Block Limit SM [block]	24
